

# Compost Shed

**Contact for more details:**  
82 7373 3030/82 7373 3535

The compost shed is an important part of our sustainable waste management practices. With the help of composting techniques, this specialized unit turns organic solid waste into nutrient-rich humus, which acts as an effective plant fertilizer. The composting process involves the utilization of biodegradable waste from the farm, along with cow dung & solid

waste from the biogas unit. We use two types of composting techniques: vermicomposting and composting from microbes. In these techniques, earthworms and microbes' culture such as Gokrupa Amratam play an important role in breaking down organic matter into nutrient-rich compost.

***The dimensions of our compost unit are: 60 x 100 sq. foot***
